North Hills Pediment Focus Model Schematic View

Computed groundwater surface compared to observed groundwater elevations

Well 64737
State Lands East

Computed vs. observed groundwater levels

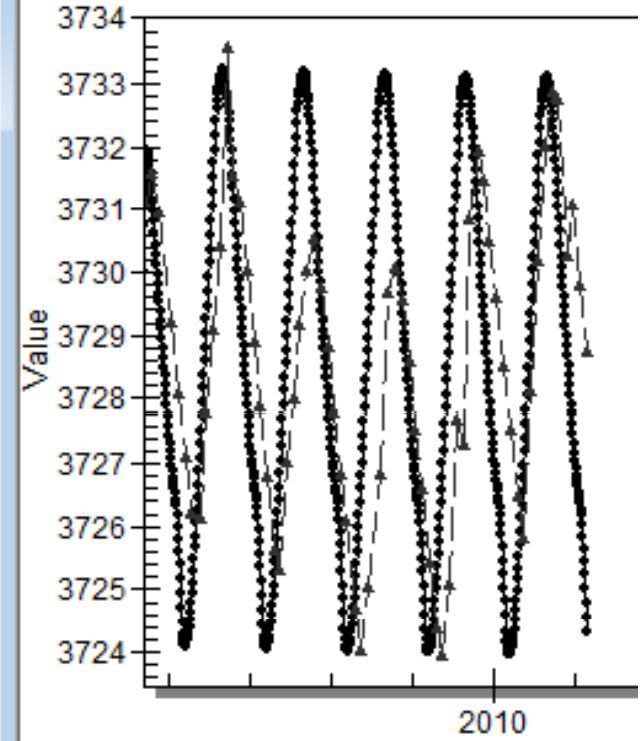

Well 191532 North Hills

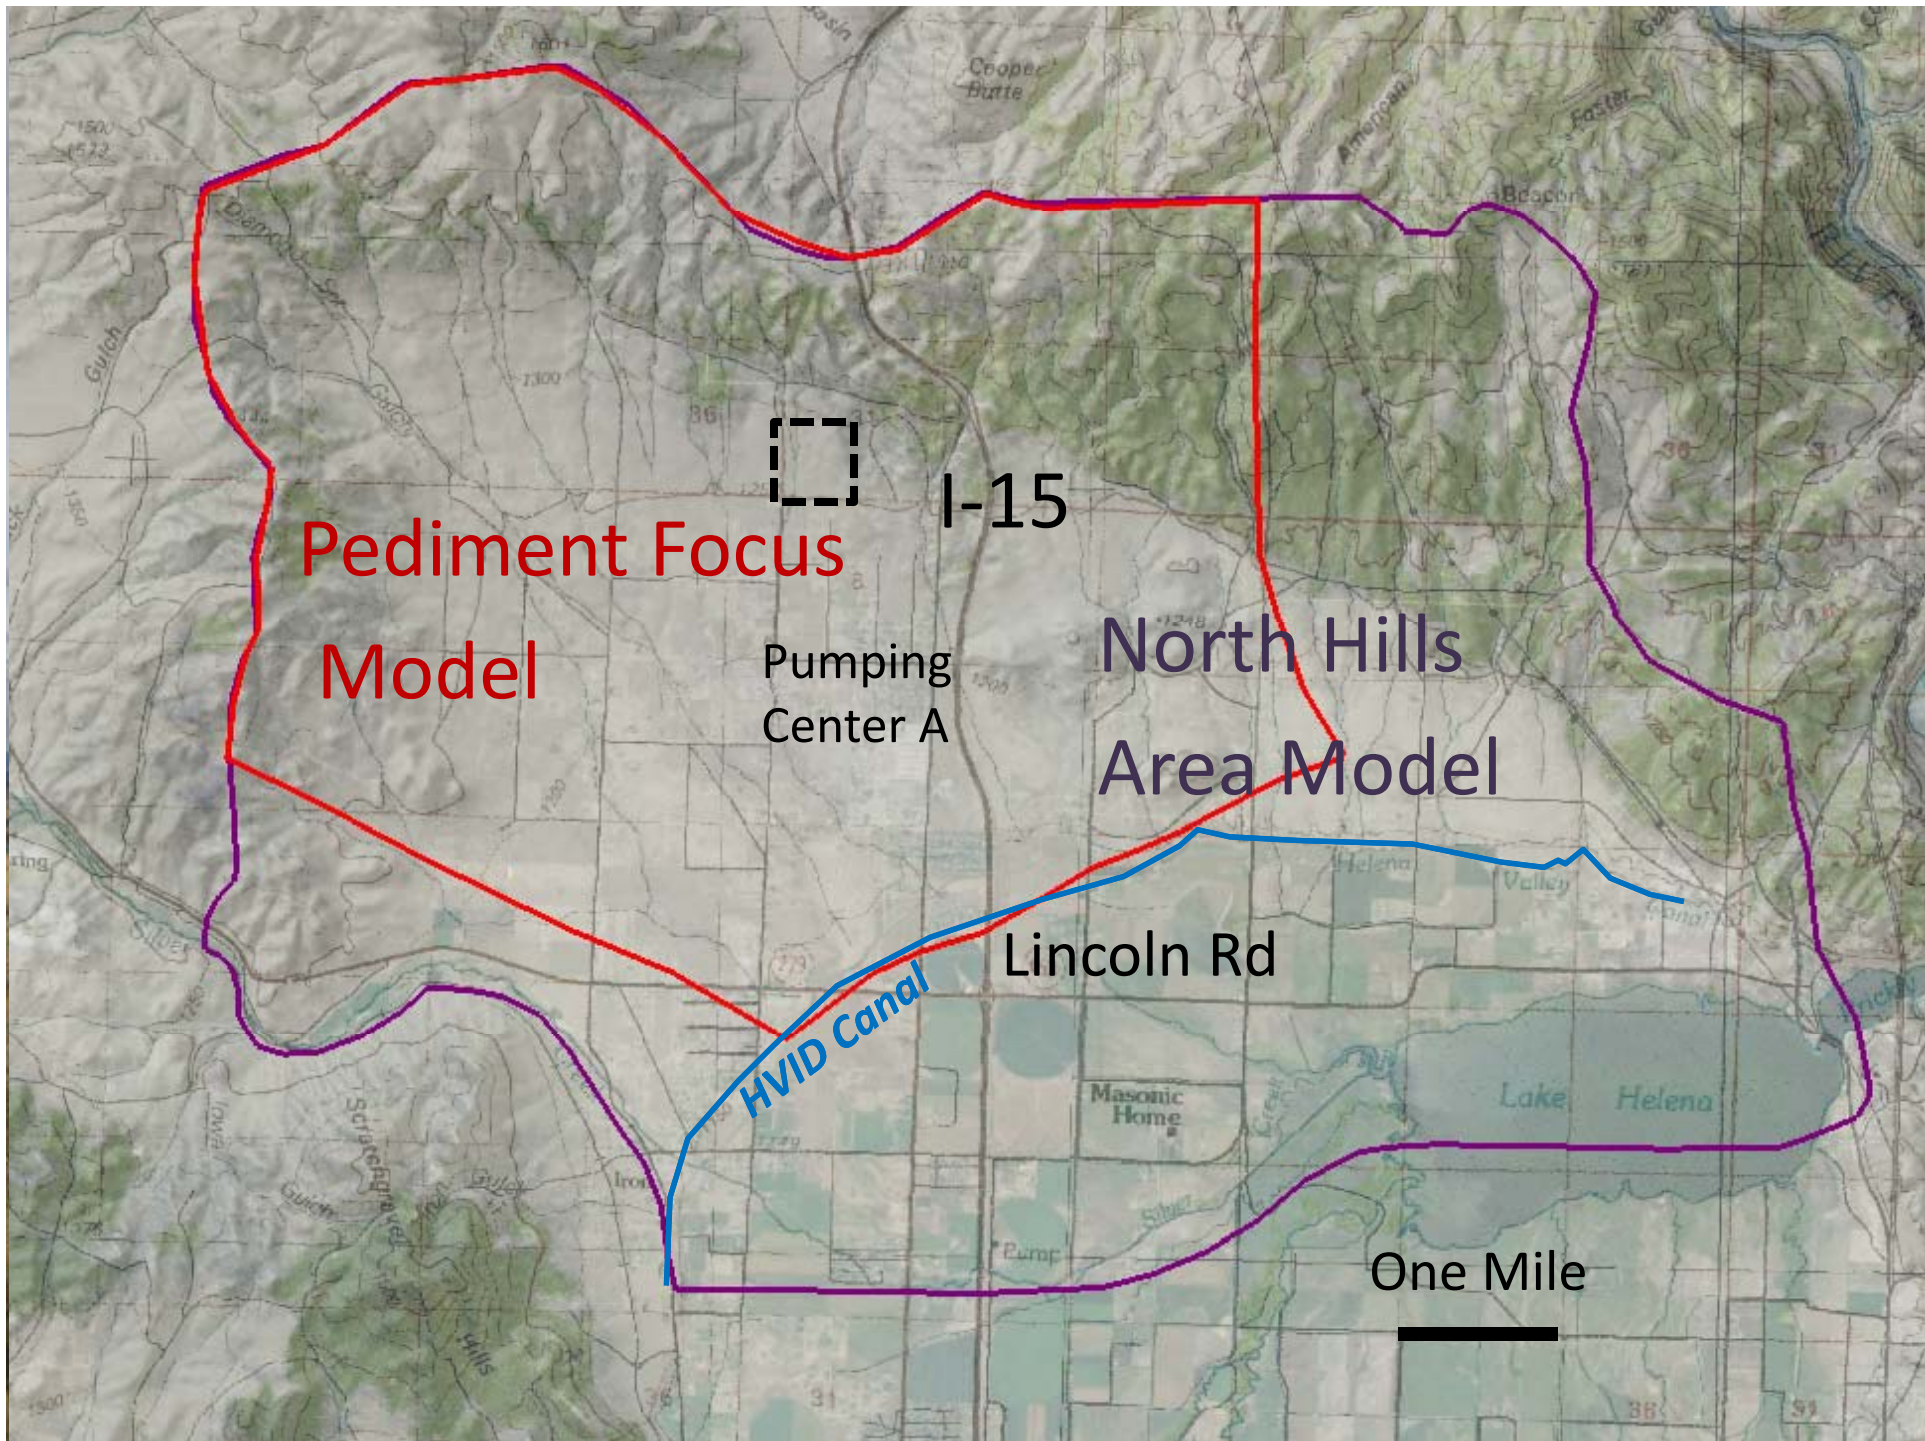

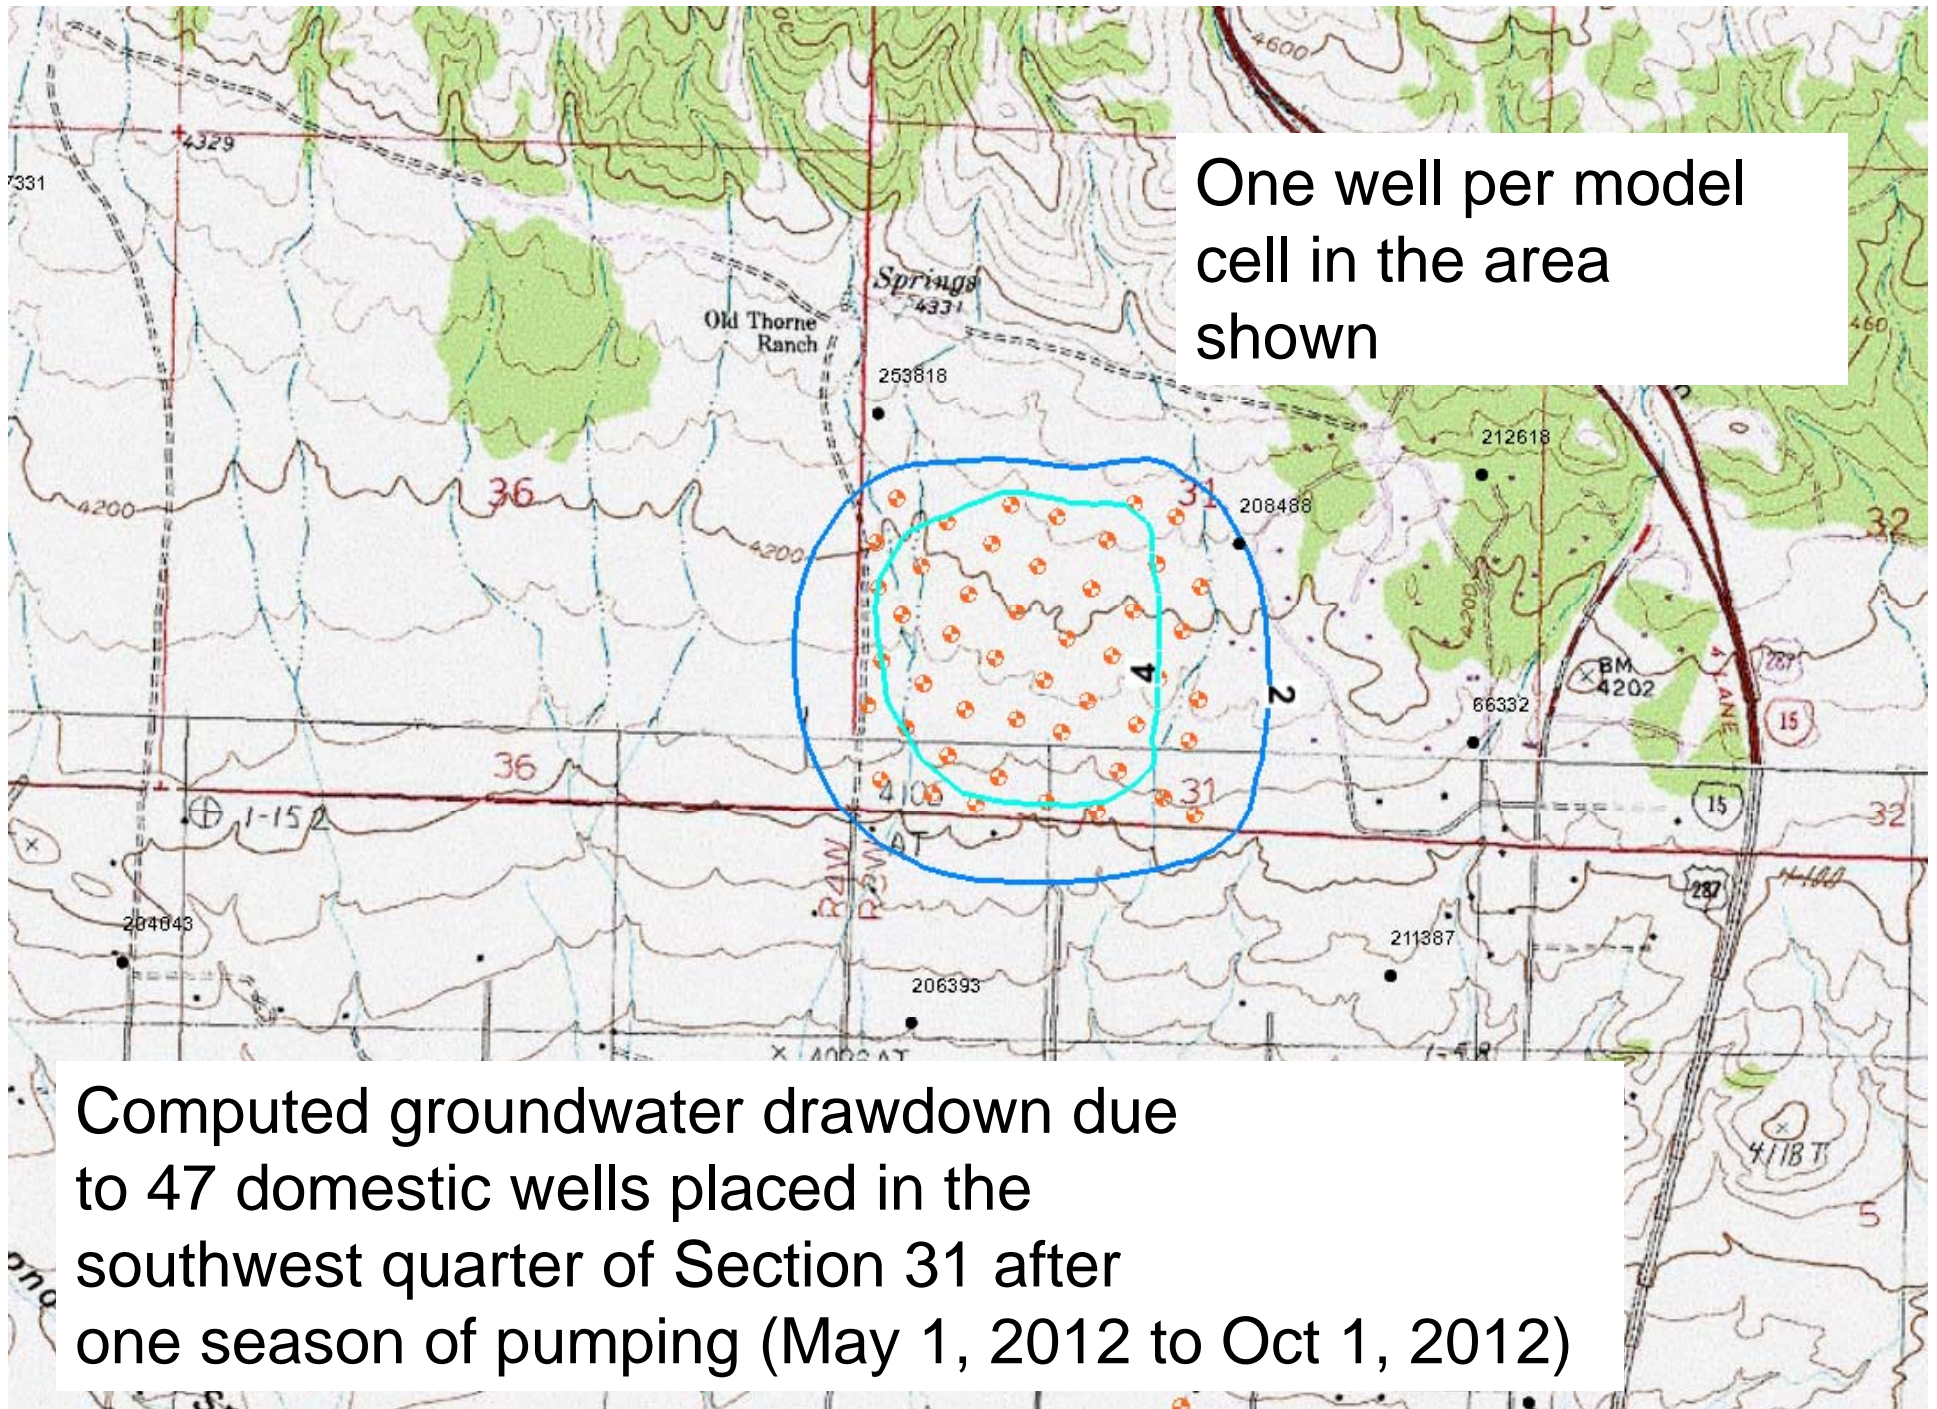

Well 64737 State Lands East

Well 19993 Tangen

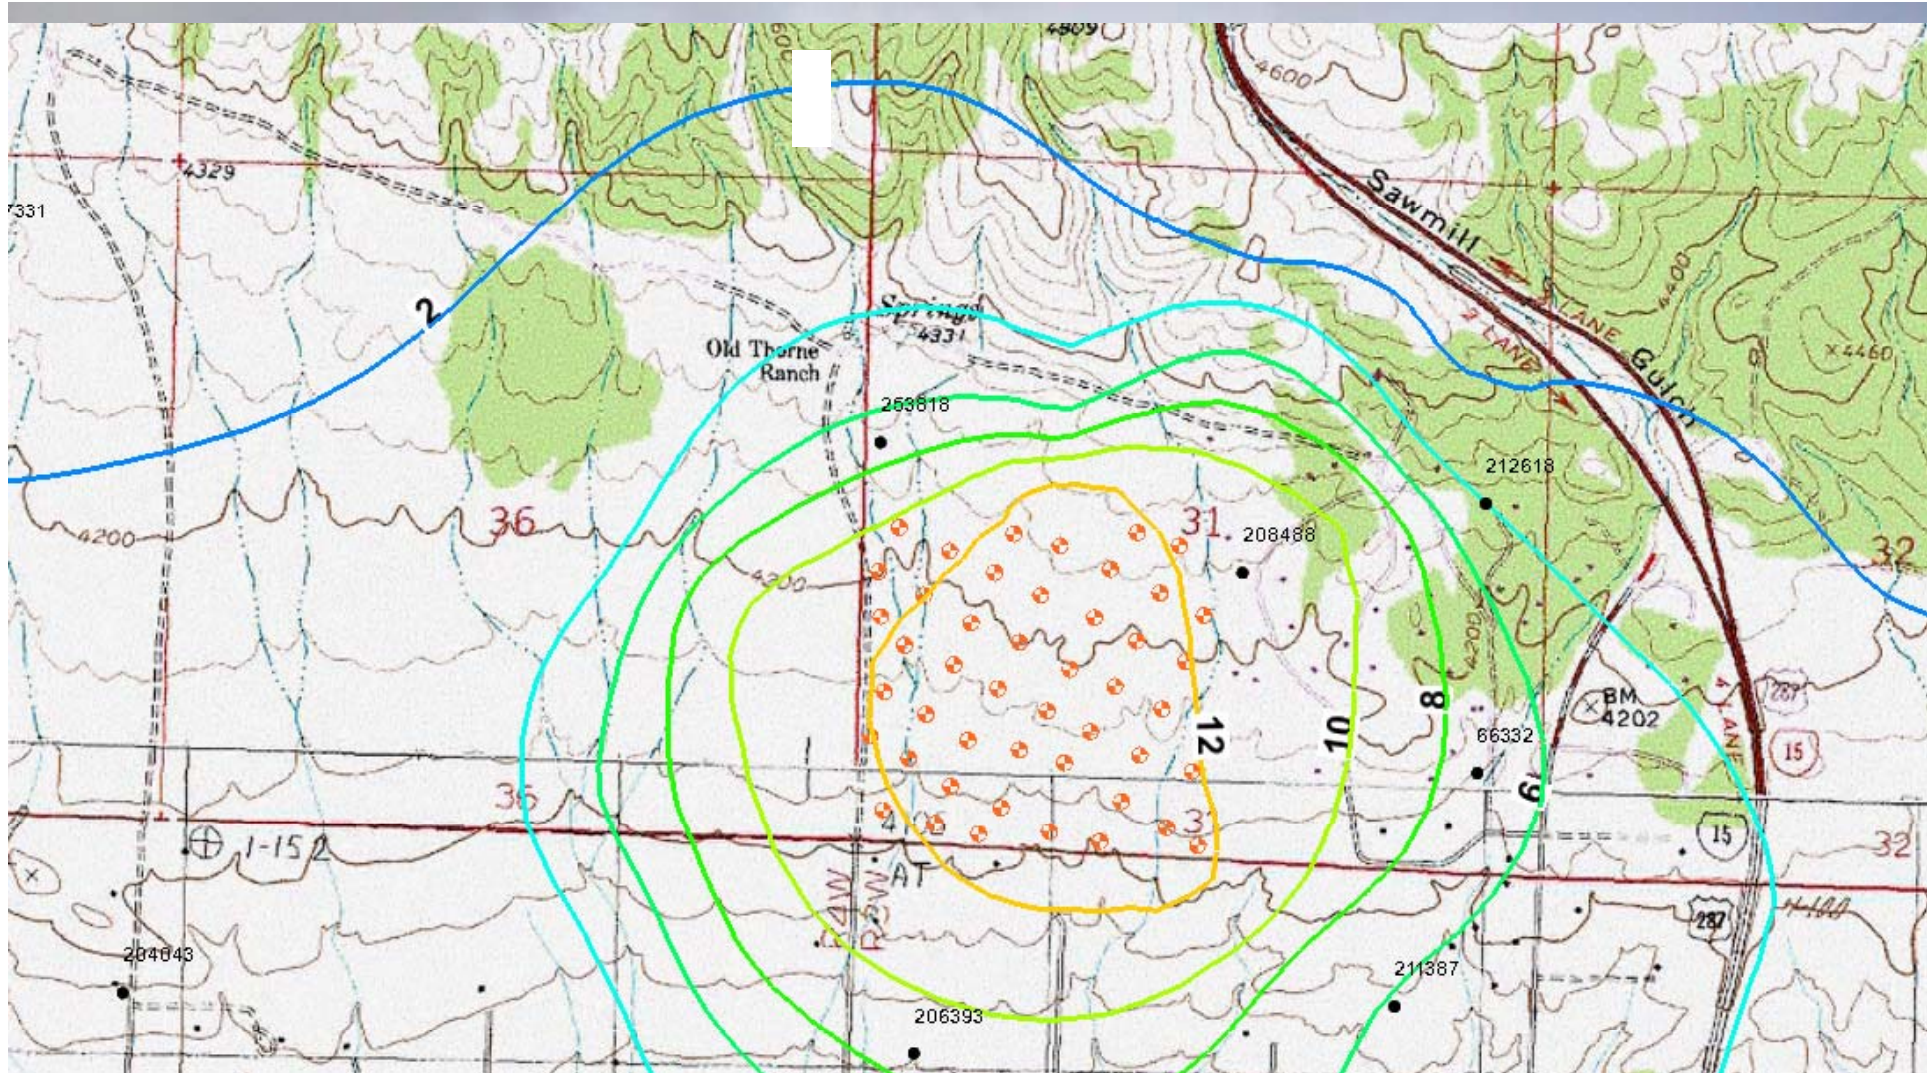

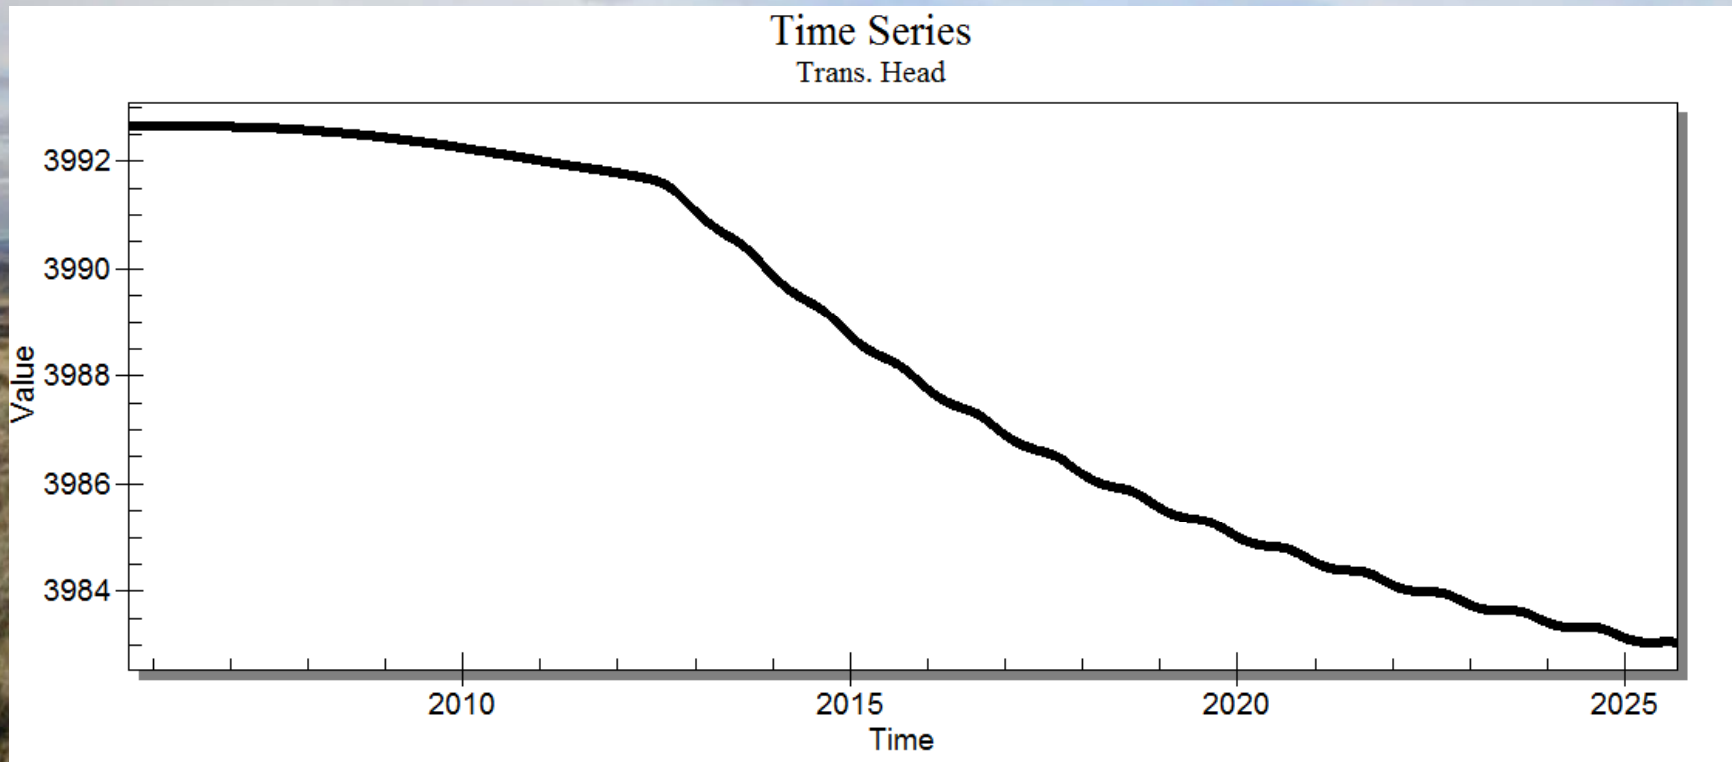

One well per model cell in the area shown

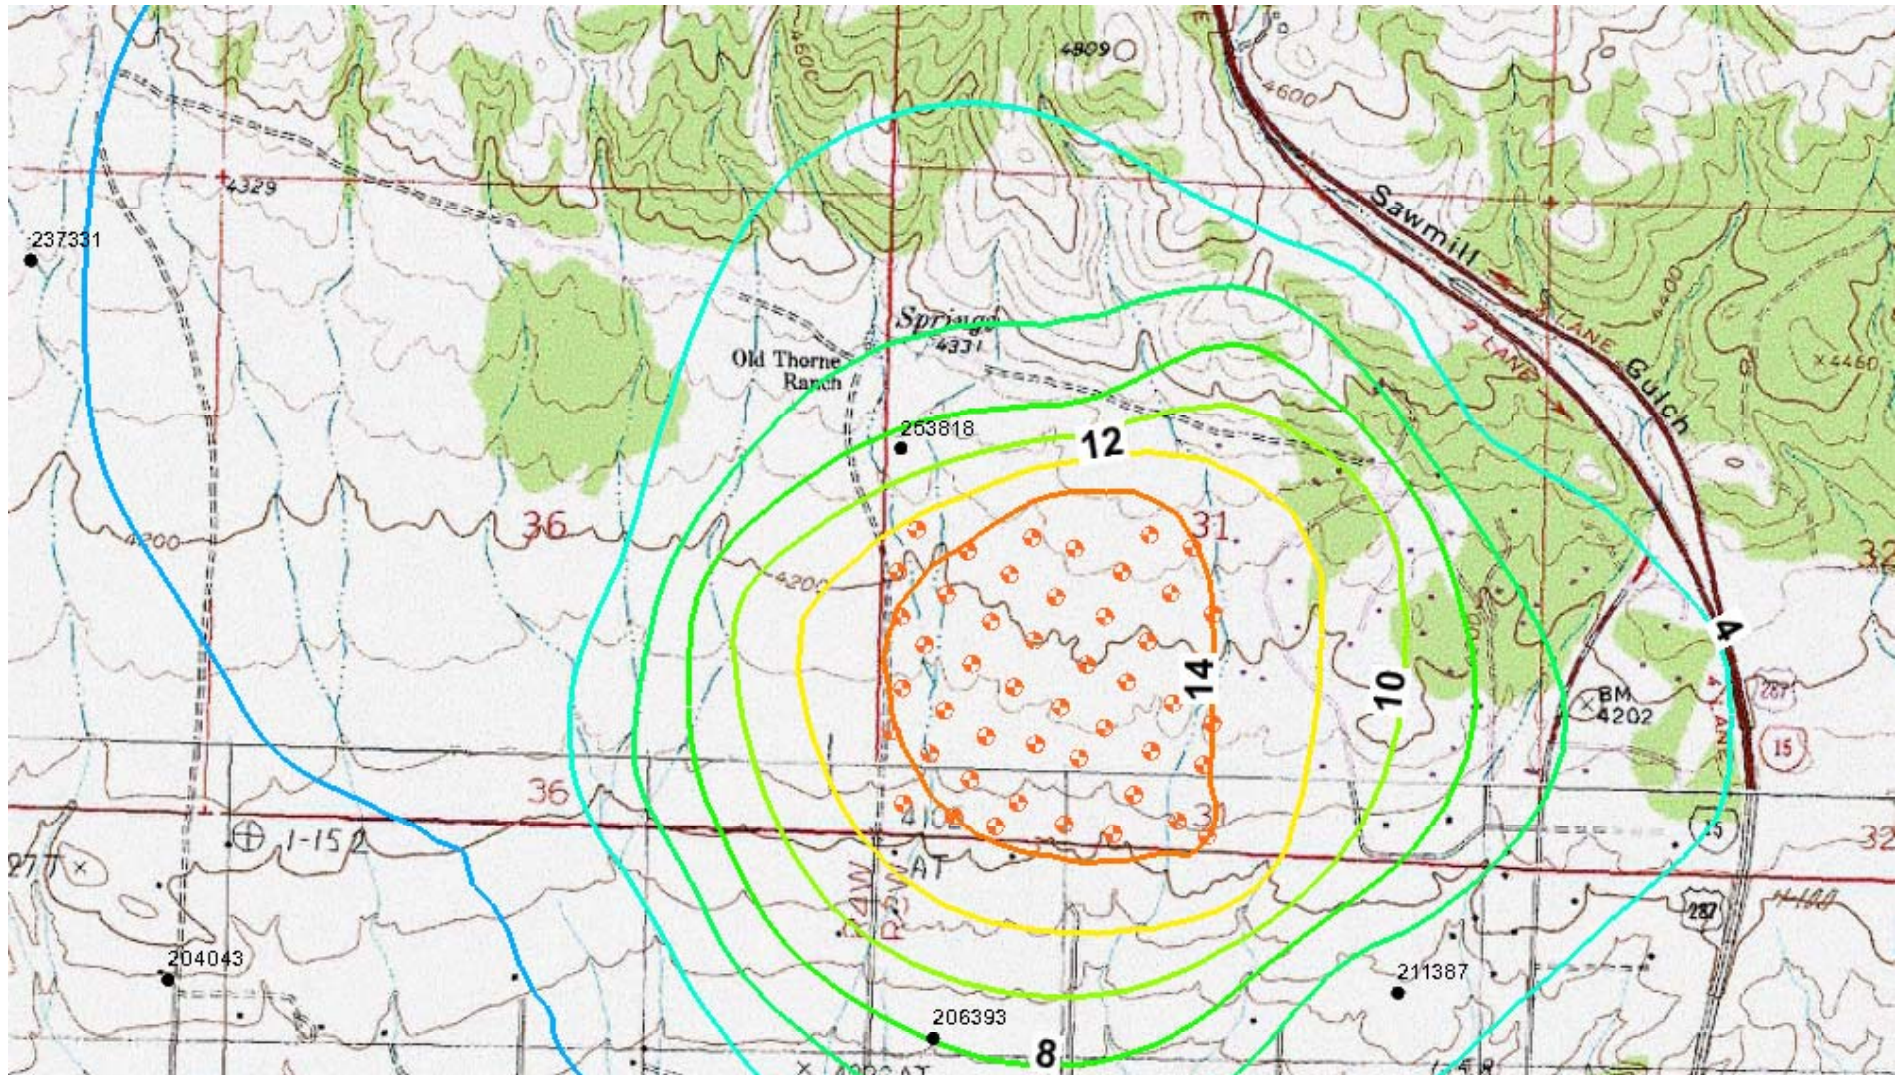

Computed groundwater drawdown due to 47 domestic wells placed in the southwest quarter of Section 31 after one season of pumping (May 1, 2012 to Oct 1, 2012)

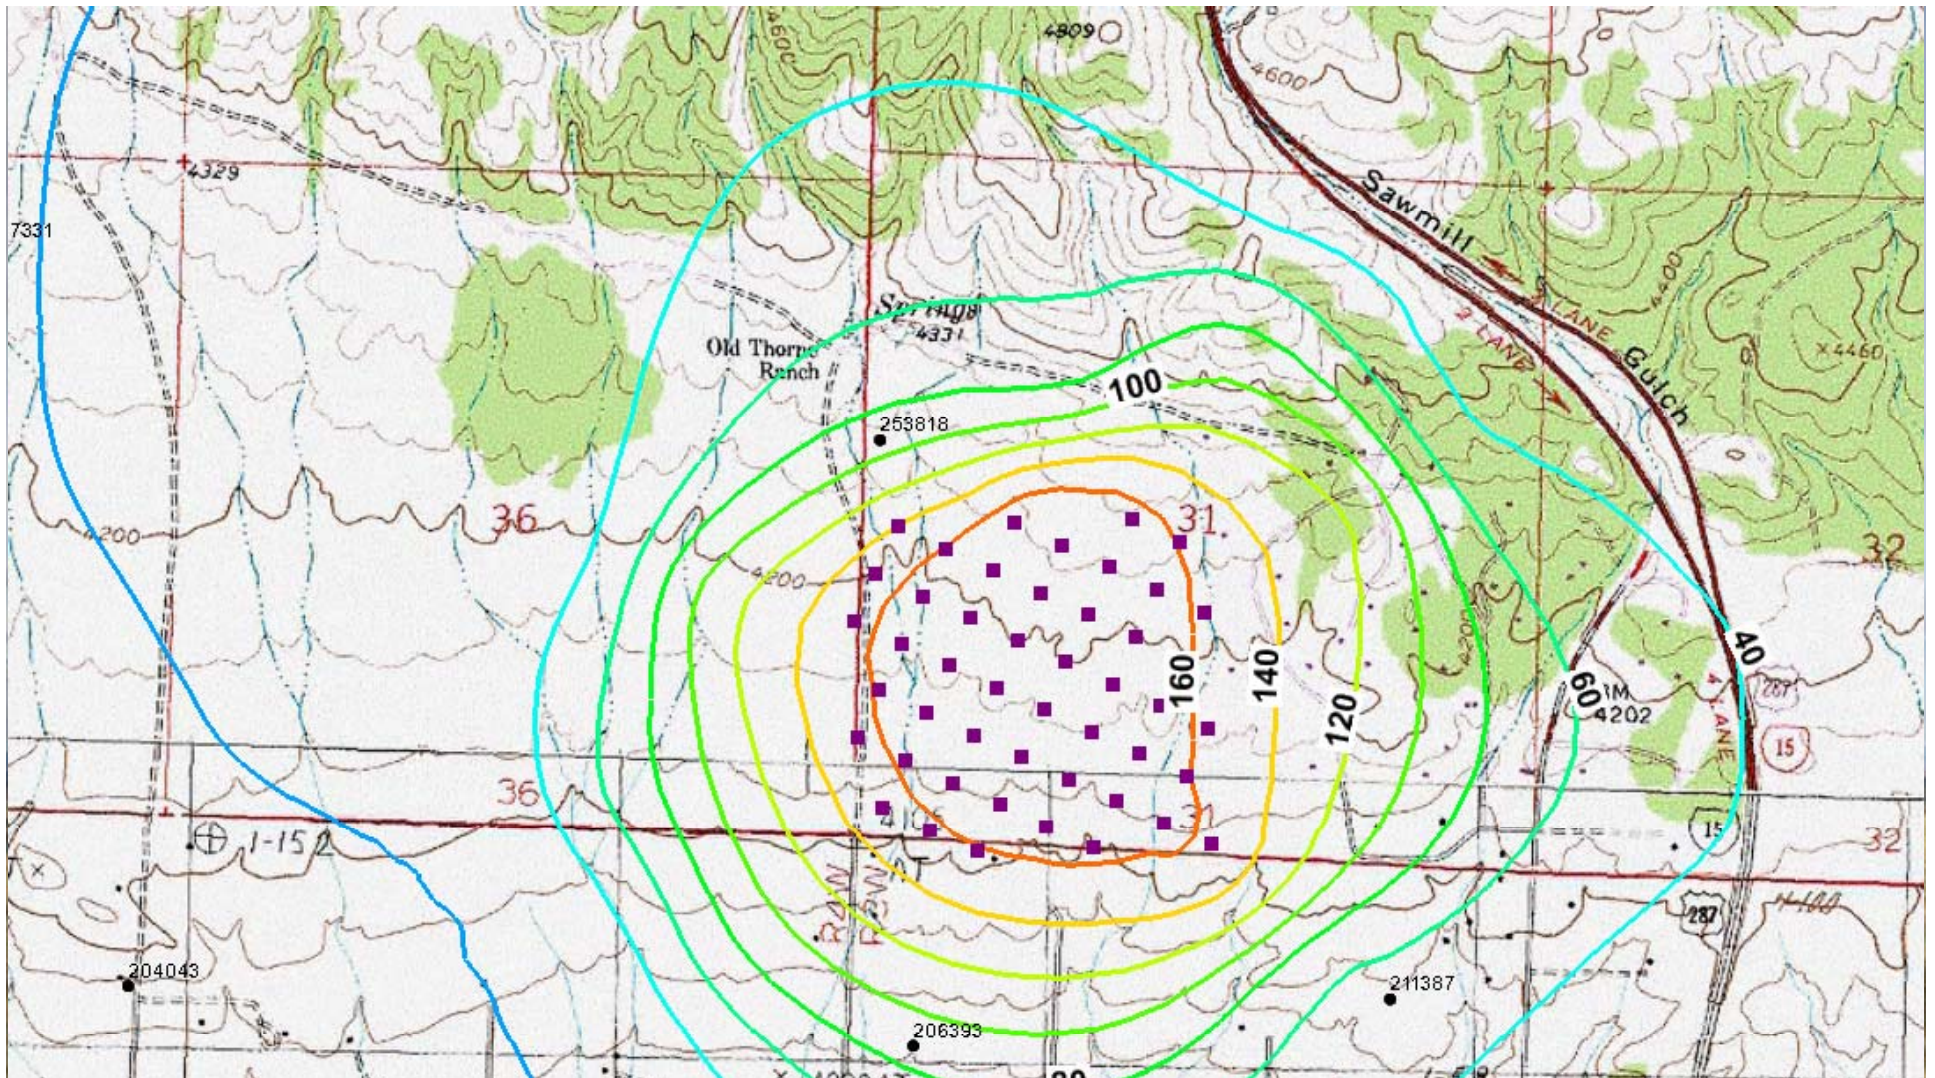

Computed groundwater drawdown due to 47 domestic wells placed in the southwest quarter of Section 31 after fourteen seasons of pumping (May 1, 2012 to Oct 1, 2025)

Drawdown impacts over time at well 206393 located about ¼ mile downgradient of the development

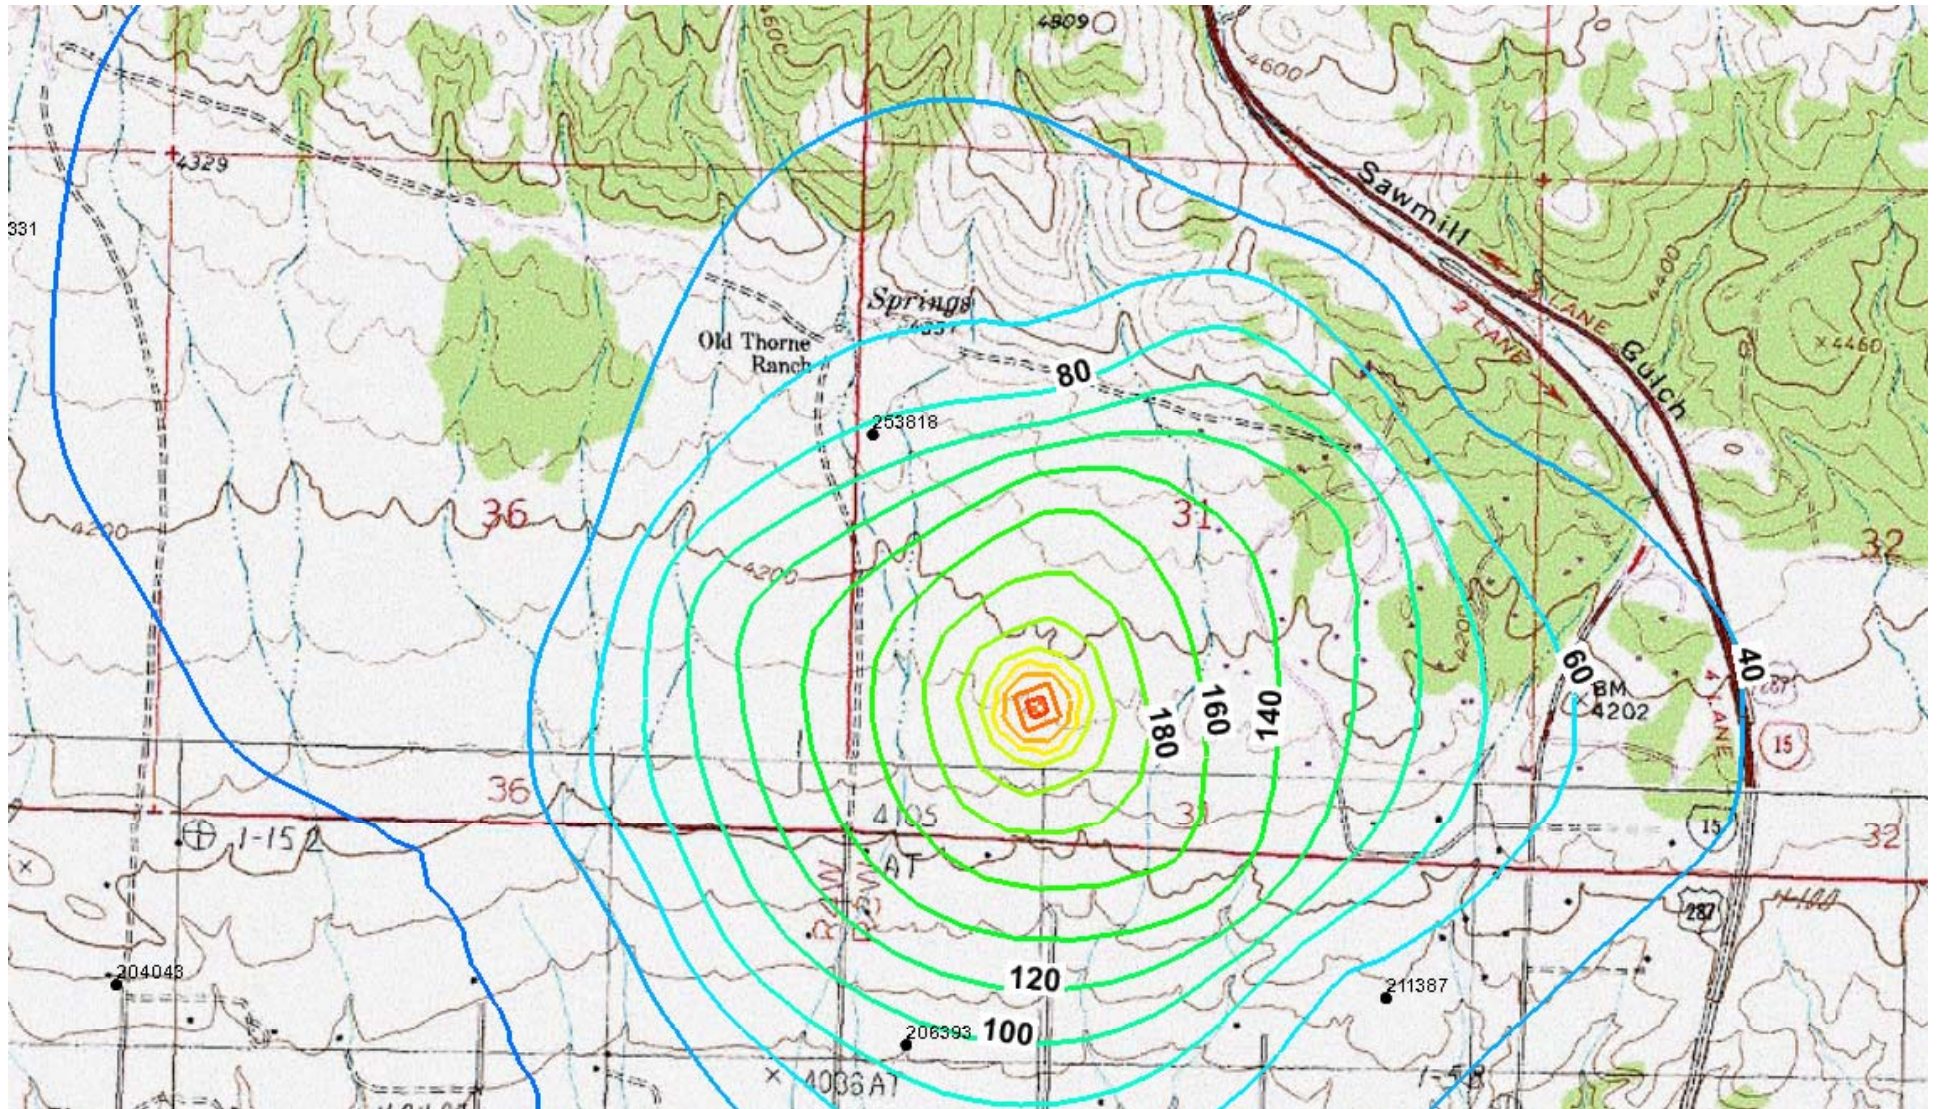

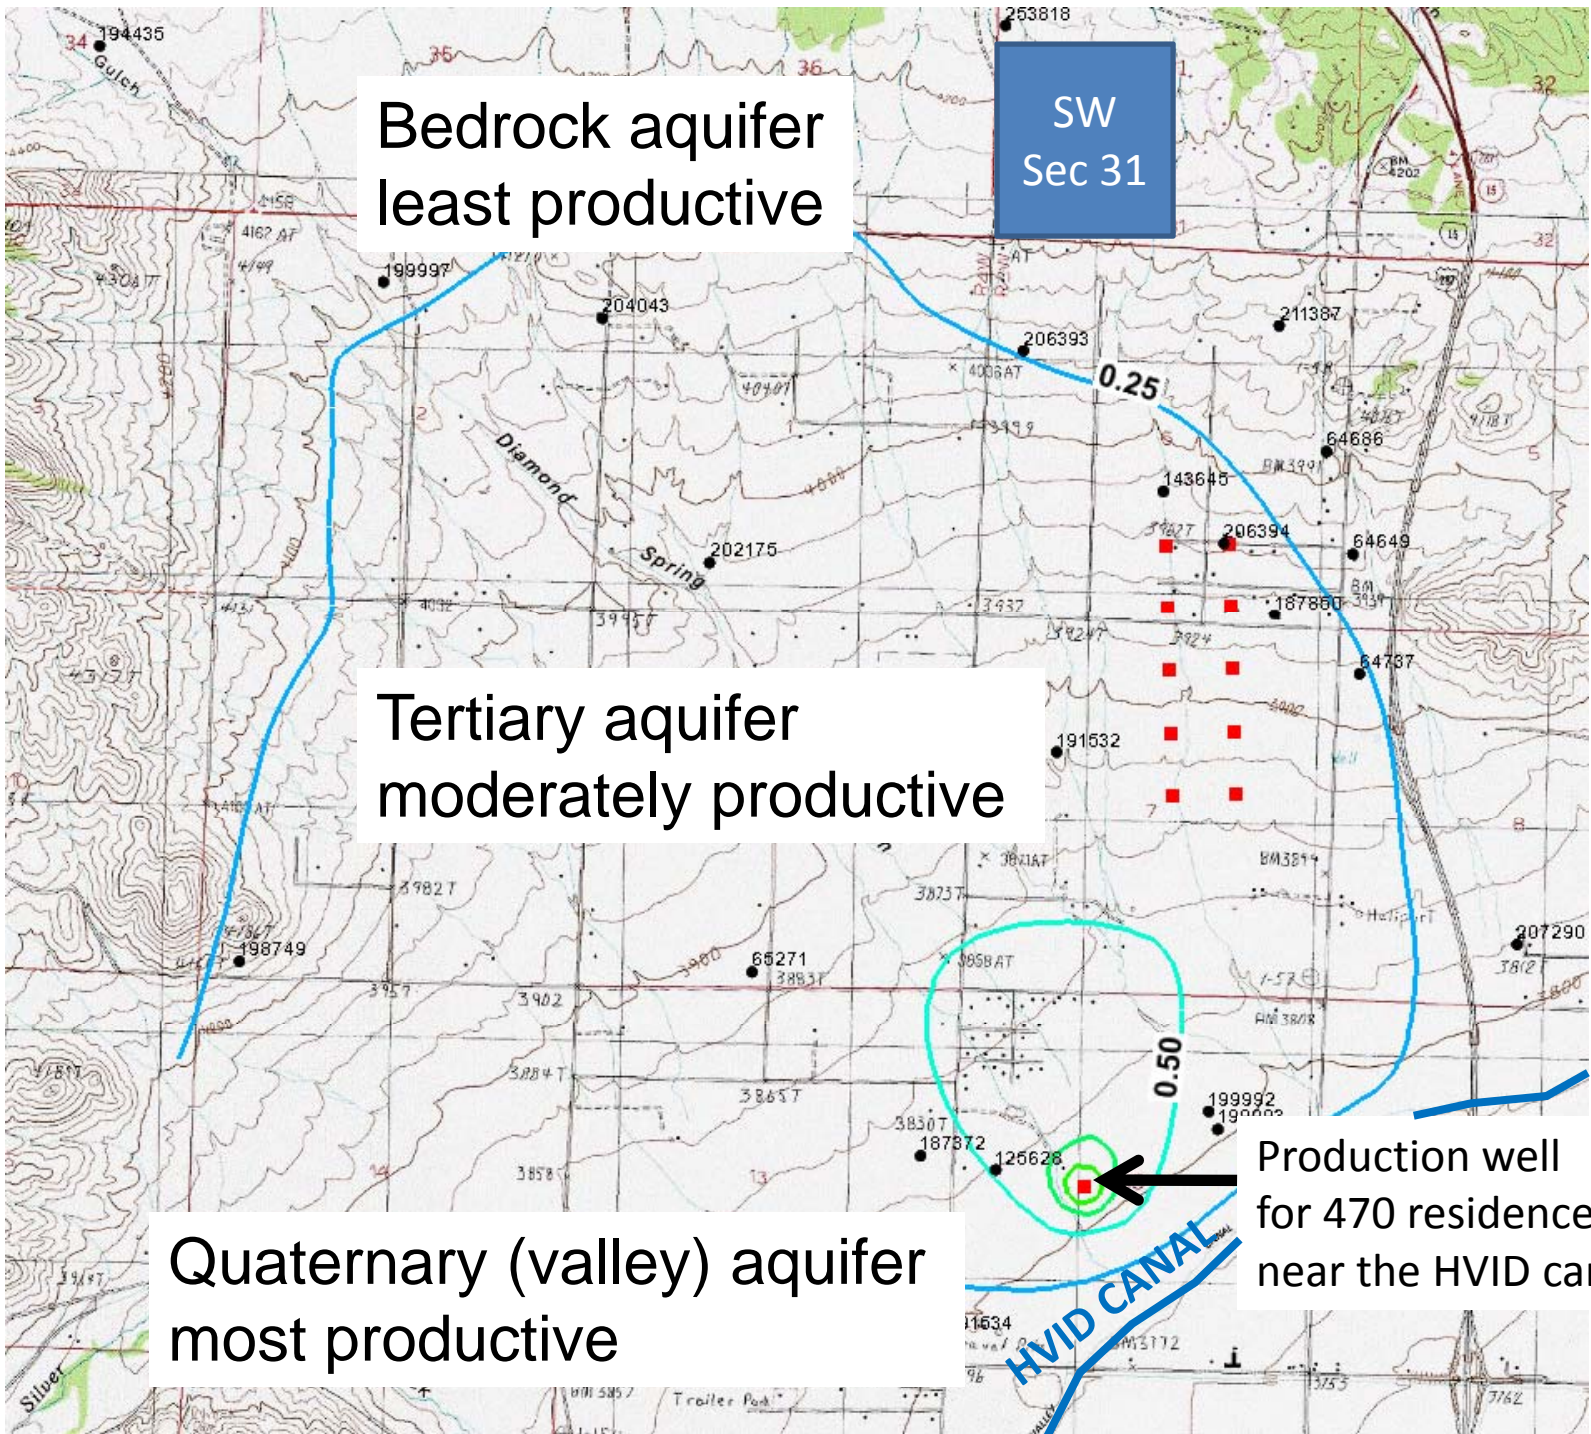

Computed groundwater drawdown due
to 47 domestic wells placed in the
southwest quarter of Section 31
Steady-state solution

Computed groundwater drawdown due to 470 residences drawing water from 47 wells placed in the southwest quarter of Section 31
Steady-state solution

Computed groundwater drawdown due to 470 domestic residences placed in the southwest quarter of Section 31 – with one public water supply well
Steady-state solution

Bedrock aquifer
least productive

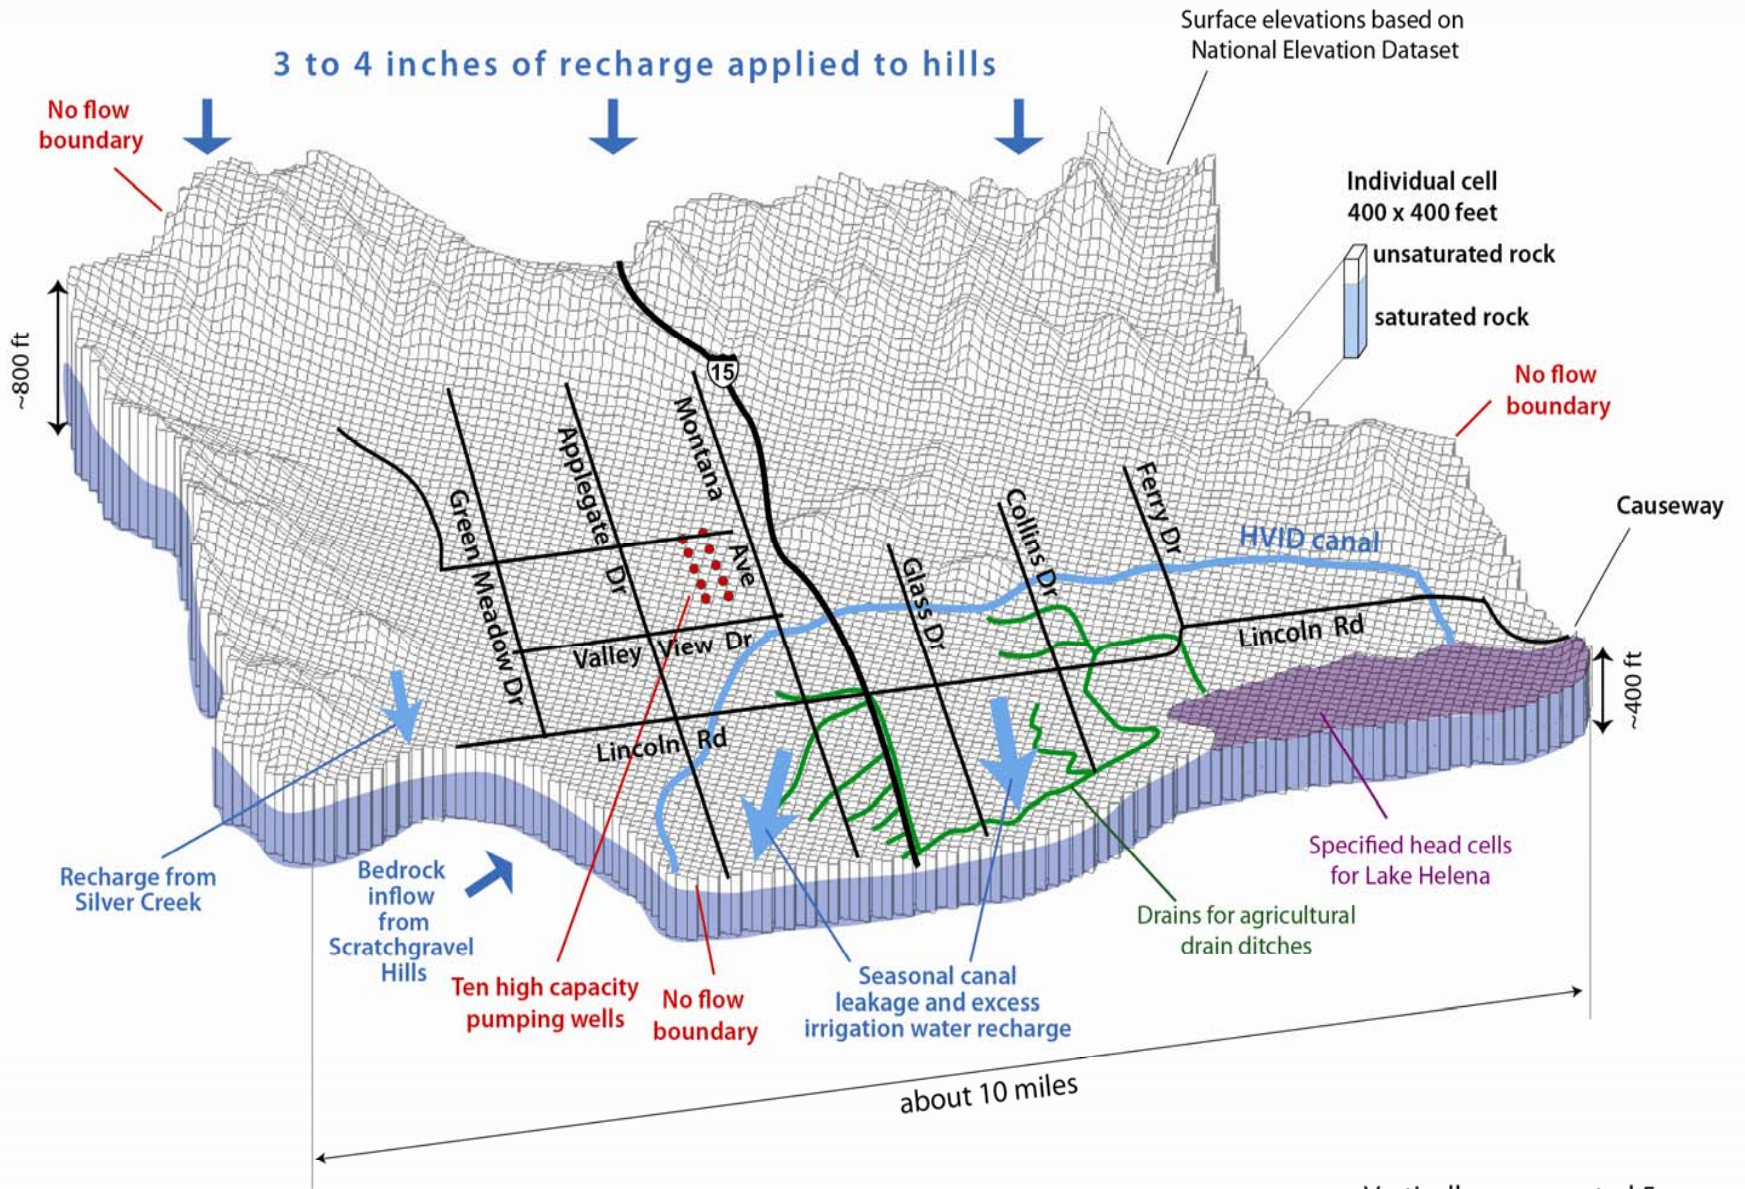

SW
Sec 31

Tertiary aquifer
moderately productive

Quaternary (valley) aquifer
most productive

Production well
for 470 residences
near the HVID canal

pumping rates at
Pumping Center A

North Hills Groundwater Models capabilities:

- Estimate drawdown from additional groundwater withdrawals
- Estimate drawdown or recovery from increases or decreases in pumping in current developments
- Estimate timing and magnitude of impacts of groundwater pumping to Lake Helena (Missouri River)
- Analyze the effects of other hydrologic changes such as draughts, changes in irrigation practices, etc.

Water Budget Impacts of Pumping
